

Claims

What is claimed is:

1. A method for data transfer or transferring data using wireless mobile phone and any other wireless mobile devices, that are able to access, search, post, update and delete any type of data files or database using wireless mobile phone and any other wireless mobile devices and also able to access, search, post, update and delete the same data files or database files online or offline or both online and offline using computer on a very secure environment with data integrity.
2. A method for accessing, searching, posting, updating and deleting any type of data files or database using wireless mobile phone and any other wireless mobile devices and also able to access, search, post, update and delete the same data files or database files online or offline or both online and offline using computer on a very secure environment with data integrity.
3. A method for WAP Shopping Site with catalog System that allows for the displaying, browsing, and searching of products with WAP shopping cart that allows visitors to add, view, and delete items ordered and allows visitors to check out, when visitors check out they are presented with a secure page to supply their personal information with built in 24 Hour a Day, 7 Days a Week Support System providing customers with feedbacks and communications, using database like Access Database, SQL Server, Oracle Server etc.
4. A method for WAP Shopping Site with catalog System that allows for the displaying, browsing, and searching of products with WAP shopping cart that allows visitors to add, view, and delete items ordered and allows visitors to check out, when visitors check out they are presented with a secure page to supply their personal information with built in 24 Hour a Day, 7 Days a Week Support System providing customers with feedbacks and communications, using database like Access Database, SQL Server, Oracle Server etc, and customers are also able to shop online on this shopping site using their computers.

My invention is different from both the invention of Christensen and Covington.

In Christensen PDA he talk about gathering, updating, changing etc. data within a database through a PDA and any hand-held wireless device but the way those data are transfer and different from my system.

In Christensen PDA a data is enter into the PDA which contain a software system which translate this data to database format. To transfer this data to a PC this PDA is connected to the PC with a special cable design for the PDA, the data are then transfer to the PC which contain an interpreter software system that interpreted this to the PC database format, this system then update the PC database. This is not wireless transfer because to transfer and update the PC database file you have to use cable to connect the PDA to the PC. He/She knows this and that is why he/she could not specify or explain this in his/her system. According to how he/she explains this is that using wireless to transfer data is just a mean of transferring store data wirelessly to PC.

In my invention there is no data store in the hand-held devices and there is no any cable connection to the PC. Here when you working with data you are working with data directly from the database file from the computer/data storage, when you update from your device you update the data in the computer/data storage when you delete you delete the data in the computer/data storage, just as when you are at home working with some of your data files in the office with the help of the Internet. Any data you change here automatically change the office data, so is my system the only different here is that you are doing the things you do with PC using wireless mobile device.

In Covington case his/her system have nothing to do with wireless technology. He/she only talk about application you can use to shop using PC.

WAP technology is a new technology which give you the power to do great things wireless.
